

## **INSTALLATION - WINDOWS**

Run 'aksys23.exe' first to install ak.Sys V2. This will be suitable for Z4, Z8 and MPC4000.

If you also have an S5000 and/or S6000 which you want to integrate into ak.Sys V2, next run 'S56ak23.exe' to install the S5/6000 components.

You will also need to install the S5/6000 USB drivers ('S56kUSB.zip'). Create a new folder and place both the files ('USB Driver.inf' and 'USB Driver.sys') files into that folder. Now switch the S5000/S6000 on and connect it to the PC via a USB cable. This should prompt you that the PC has found a new hardware device and requires new drivers. You need to specify a location for the drivers so browse to the folder you created that contains the drivers and press OK. The driver should now be properly installed and the S5000/S6000 should be recognized.

If you want the extra S5/6000 program editor themes, after installing the main installers as described above, download and run 's56thmwn.exe' to install the Program Editor themes.

**NOTE:** If you have an older version of ak.Sys installed, you should un-install this before proceeding as described above. To uninstall older versions either use the original installer's remove option or use control panel: add / remove programs.

## **INSTALLATION - MAC**

Install aksys23 using the Installer. This will be suitable for Z4, Z8, MPC4000 and S5/6000.

If you want to use the extra S5/6000 program editor themes, download the file 'themes.sit.hqx' and unstuff it. Now open the ak.Sys folder and place the THEMES folder in the PLUG-INS folder.
